You see the table with leads and company data and each row has its own **requirements (req)** and **sub status**.

Row data should meet requirements and get value **VALID** as result. Otherwise it will be **INVALID**.

Sub status explains what exactly we need to check in requirements.

Task:

Write the code that can check data by **sub status**, and compare data by requirements.

- 1) Check **sub status** to choose the recheck logic.
- 2) Read requirements and compare them with data in row.
- 3) Output in **Result** column **VALID** (if row meet requirements) or **INVALID** if there are mistake in data.
- 4) The short notification in the **Comment** column that describes what data were wrong.

Sub statuses meaning:

- N/A: Title/PL Summary - check title. It should contain the right keywords and level.
- N/A: Other (auto) - check company and lead data.
- N/A: Prooflink - **prooflink** should be [linkedin.com/in/](https://www.linkedin.com/in/) or zoominfo.com/p/ or it can be an official website that matches with corporate email.
- N1: NWC - depends on 'status' column and values in it:
 - If empty or 'valid' -> **VALID** in Result.
 - if **status** has a value 'a' -> retired lead, **INVALID**
 - if '!' - suspicious lead, **INVALID**
 - 'r', 'no info', 'no company match' value in status -> **RECHECK** value in Result

There is an example of output after code processing.

Test sheet:  DataCheck_DemoCode

What do we expect to get:

- 1) the XLSX / CSV file with results of your code that processed Test table above with Result data as accurate as possible.
- 2) Doc with logic description of your code work.
- 3) Add notes how you would process the sheet with **country check** requirements if you had only region/county in location column and big volumes on the sheet (50-70k rows).
